Information regarding the Grackle cooling table in AGORA simulations is available in the following subpage:

<https://sites.google.com/site/projectagoraworkspace/metagroup1/group1/common-cooling-library>.

– Task: Provide a common physics package for cosmological simulations, write a flagship paper introducing the comparison project and its rationale

– Description: We will provide a package of common physics for cosmological simulations. Participants to the Project will agree to a minimal set of common input parameters, from the initial stellar mass function to the metal yield, and to the ionizing ultraviolet background. Gas cooling tables as a function of density, temperature, metallicity, and UV background (or redshift) will be provided over the next six weeks or so to all Project participants for code implementation. We also aim to reach the first milestone of this project by publishing a flagship paper on a proposed comparison, common physics, and common analysis, in late 2012. **[authored by Piero Madau]**
