Common Cooling Library

The radiative cooling for AGORA simulations uses the [Grackle cooling library](#), which features (non-)equilibrium primordial chemistry and cooling, tabulated metal cooling, and a metagalactic UV background.

- Instructions for building the library and implementing within a simulation code can be found [here](#). For any installation or implementation questions, contact its [Google Group](#) or [Britton Smith](#).
- In particular, thanks to the great effort by Britton Smith, a fully tabulated mode of GRACKLE is now ready. Please see his announcements ([1](#), [2](#)) for more information.
